JOURNAL OF THE
MISSOURI NATIVE PLANT SOCIETY

INDEX

Missouriensis is the official publication of the Missouri Native Plant Society. Founded in 1979 as a non-profit corporation, the Society is devoted to the conservation and study of the plants growing wild in Missouri, to the education of the public about the significance of the native flora and its habitat, and to the publication of related information.

Minutes of the Board Meeting

MISSOURI NATIVE PLANT SOCIETY

Saturday, January 14, 1984

Dept. of Conservation, Jefferson City, MO

CALL TO ORDER

The meeting was called to order by President Melvin Conrad.

MEMBERS PRESENT: President Melvin Conrad, Vice President Nancy Morin, Treasurer John Karel and Secretary Jean Webdell; Paul Redfearn, Ginny Wallace, Paul Nelson, John Molyneaux, Joanna Turner, John Doggett, Jay Raveill, David Castaner, Monte Holder, Ernestine Wagner, Marshall Wagner, Rick Thom, Edgar Denison, Bill Summers, Mervin Wallace, Randal Clark, Martha Daniels, Sherry Morgan, Mary L. Lehmann, Jean Freiling, John Wylie, Jim H. Wilson, Jim and Alberta Shaw, Kathy Nelson, Richard Guyette, Mary Susan Taylor, and Wally Weber.

MINUTES OF THE FALL BOARD MEETING

The minutes were approved with the correction of Wally Weber's address, which was listed as Southeast Mo. State and should be Southwest Mo. State.

MEMBERSHIP

Jim Henry Wilson and John Karel reported that changes in membership policy were decided on and carried out by themselves and Dept. of Natural Resources Staff member Gerry Harris. They acted as follows:

Membership renewal notices and questionnaires were mailed January 10, 1984, to all members, except those who have paid dues between 7/1/83 and 1/10/84. By doing this mailing on an annual basis, the treasurer's responsibilities will be simplified. A follow-up renewal notice will be mailed in mid- to late February to those who have not paid.

Memberships not renewed by March 31, 1984, will be removed from the active membership file.

The 1984 membership will be for the period of July 1, 1983, to September 30, 1984. Renewal notices for 1985 should be mailed in October or November 1984.

During the week of January 16, the questionnaire will be mailed to members who have already paid their dues.

The question of giving a receipt for membership or a membership card was discussed. As no membership cards are known to be in existence, it was decided that membership cards should be printed on the inside of the MISSOURIENSIS cover and this would serve as a receipt for those who join. Responses by letter or post card were felt to be too expensive, but it was discussed that information and/or membership cards, receipts, or whatever could be mailed to new members.

366 renewal notices (and questionnaires) were mailed to members. After a discussion, it was decided that John Karel will summarize the results and pass on appropriate information to members as well as sending the results to MISSOURIENSIS.

Edgar Denison reports that he knows of members who have not received copies of MISSOURIENSIS. Lost members are instructed to contact John Karel, Dept. of Natural Resources, so that they can be found.

TREASURER'S REPORT

Wallace Weber brought up that the Mo. Native Plant Society had agreed to pay half the expenses of the meeting held in conjunction with the North American Prairie Foundation at Missouri Botanical Garden. While MONPS has not received a bill from the Prairie Foundation, it was suggested that Wally Weber ask for a bill to be presented.

Treasurer John Karel did outline the expenditure of \$528.11 already given to the Seventh North American Prairie Conference. The expenses included \$274.78 for copies of MISSOURIENSIS, \$42.48 for other printing, and \$210.85 for postage, totaling \$528.11.

The Operating Statement for 1983 showed a deficit. Income from membership totaled \$524.50, patches and decals brought in \$181.35, for a total of \$705.85 income. Expenses included: postage \$299.11; telephone \$96.51; printing \$635.61; supplies \$41.03; miscellaneous \$40.62 - totaling \$1,112.88. Difference of income over expenses was \$407.03.

From October 7, 1983, to January 13, 1984, the report of the treasurer is as follows: Cash on hand \$2,999.11; income from membership \$64.50; for a total income and cash of \$3,063.61. Disbursements: Jefferson City Postmaster, postage for renewal notices \$73.20, leaving a balance of \$2,990.41.

Paul Redfearn made a motion that the Treasurer's report be approved. It was seconded by Wally Weber and the motion approved by the membership.

Members then introduced themselves.

OLD BUSINESS

John Wylie of the Department of Conservation specially recognized Conservation employee Rich Guyette, who has conducted important research on interpretation of tree rings.

No other old business was brought up.

INVENTORY COMMITTEE

Jay Raveill, who has been appointed chairman of the committee, reported that country records are continuing to be compiled so that the information can be placed on county maps and given to members. He noted that the Inventory Committee must decide technical issues such as things to avoid and what must be done to make the inventory consistent.

ENDANGERED SPECIES LEGISLATION - H.B. 1079

John Wylie reported that this legislation is needed to expand existing laws to include plants, the need is particularly important now because of the expanding collection and exporting of commercial ginseng. Under the legislation, native plants will be protected for the first time in Missouri.

Native Plant members were encouraged to send letters of support for the legislation to the Chairman of the House Agri-Business Committee Rep. Robert L. Dunning, Sr. and to Representative LeRoy D. Braungardt, who introduced the legislation. In addition to letters, it was suggested that members of MONPS appear to testify in favor of the bill; however, the date and time of the hearings were not known.

Letters were sent to Representatives Dunning and Braungardt and included the following resolution:

Be it resolved that the Missouri Native Plant Society supports H.B. 1079 which would repeal Section 252.240 relating to endangered species and replace it with a new section including plants and animals.

We recognize this legislation is important for several reasons:

1. For the first time plants will be given legal status.
2. H.B. 1079 is necessary to provide regulations for the sale and export of ginseng. This is necessary in order for the U.S. Fish and Wildlife Service to approve Missouri's program of licensing ginseng dealers and exporters. Regulation will enable monitoring of populations to ensure harvestable numbers in future years.
3. This bill will not prohibit the sale of native plants. Rather it will control trade through regulations authorized by the Conservation Commission.
4. H.B. 1079 does not affect proprietary rights. Growing plants will remain, as always, the property of the landowner. In fact, this bill will serve to strengthen a landowner's ability to protect native plants growing on his or her property.
5. This bill will enable the Department of Conservation to enter into federal cooperative agreements for native plants, which will lead to better surveys, research and management for endangered plant species.

The Missouri Department of Conservation has been involved in endangered species regulation and study of both plants and animals for a number of years, including publishing RARE AND ENDANGERED SPECIES OF MISSOURI. The Missouri Native Plant Society feels that authority for protection of rare and endangered plants needs to be clarified by statute. We strongly urge passage of H.B. 1079 during the 82nd General Assembly.

MISCELLANEOUS

Mary L. Lehmann suggested that the Mo. Native Plant Society encourage the use of native plants by distributing information about where the plants or seeds could be purchased. After much discussion on the merits and legalities of re-introduction of native species into the landscape, it was decided that a committee should gather information to be put into an article. Material included would be propagation of rare and endangered species, how to grow them, and where to obtain them. Committee members are Edgar Denison, Mary Lehmann, and Nancy Morin.

The spring MONPS meeting will be held in conjunction with the Missouri Academy of Science Meeting at Southeast Missouri State University, Cape Girardeau on April 28, 1984.

MISSOURIENSIS

The next issue, which will come out in March, will include information on the results of the questionnaire if available, if not in a later issue.

An index to the first issues is being prepared for publication.

LOCAL CHAPTERS

Sue Taylor announced efforts to start a local chapter of MONPS in the St. Louis area.

ADJOURNMENT

All business completed, the meeting adjourned. A slide show on the Natural Areas Inventory of Southwest Missouri was presented by Gary Reese.

Respectfully submitted,

Jean Webdell

Jean Webdell
Secretary

MEMBER HIGHLIGHT: Dr. Leland J. Gier

In Memorium

1904 - 1983

Dr. James R. Jackson¹

The Missouri Native Plant Society, higher education, and the fields of botany, biology, and science in general lost a great friend this past summer. Dr. Leland J. Gier passed away on July 11 after a short illness. His philosophy of botany, science, education, and life itself should be a model for us all.

His love of botany was reflected in his research, which he pursued until the time of his death. This research resulted in fifteen papers relating to the ecology, pathology, and taxonomy of Missouri flora. The bryophytes were his major research subject. In addition to the numerous papers on Missouri bryophytes, his most recent publication was a 56-page work on the Thuidiaceae (Musci) of Latin America published in the JOURNAL OF BRYOLOGY. What is not reflected in his papers is the contagious excitement that he exhibited every time he went into the field or keyed out a plant. This is what made every field trip with him a joyful experience.

Dr. Gier's philosophy of science education artfully bridged the gap between the undergraduate classroom, the professional society, and the scientific meeting. He was a member of The Missouri Native Plant Society, The American Bryological Society, the British Bryological Society, The American Society of Plant Taxonomy, The Torrey Botanical Club, The National Association of Biology Teachers, and the Kansas Academy of Science. He felt not only that his membership in these organizations was crucial, but because of his influence, all of his students recognized them as the vital link in the scientific community. Dr. Gier's relationship with the Missouri Academy of Science is evidence of this influence.

The survival of the Missouri Academy of Science during the 50's and early 60's was due in a large part to the efforts of Dr. Gier and his love for science education. In 1975 he was awarded the only Honorary Life Membership in the Missouri Academy of Science for his work with the Academy, especially with the Collegiate Division, which is devoted to undergraduate research. During this same year, the Leland J. Gier Award for research was created. This award is presented annually to the undergraduate student who presents the most meaningful research in the Biological Section of the Collegiate Division of the Missouri Academy of Science meetings.

¹Missouri Southern State College, Joplin, Missouri

Dr. Gier received his Ph.D. from Duke University, and he also studied at Kansas State College at Pittsburg, the University of Nebraska at Lincoln, Oregon State College in Corvalis, and Iowa State University.

Dr. Gier committed his life to education and research. He taught for 47 years at the secondary and college levels, including Campbell College (North Carolina), William Jewel College for 27 years, and Missouri Southern State College for the four years preceding his retirement. Dr. Gier was a dynamic, charming, and inspiring person who, until the very end, was most at home in the field with his students and his plants. We all will miss him very much.

SAINT LOUIS CHAPTER FORMED

Thursday night, February 23 marked the official founding of the St Louis Chapter of the Missouri Native Plant Society. Officers were elected and a letter dispatched requesting recognition from the State Board. Dottie Epstein is the new Chapter President, Sue Taylor is Vice President, Naomi Miller, Secretary, and Karen Haller is Treasurer. Meetings are scheduled for the fourth Thursday of each month. The next program, on March 22, will be given by Dorothy Cole on the Interesting World of Trees, with a discussion on the winter identification of Missouri trees. For information on prospective programs, fieldtrips, and other activities, phone Dottie (991-2625), or Sue (664-1382).

NEWS & NOTES

Help Needed

Leonard Blake and Doris Epstein, researchers at Washington University in archaeobotany and ethnobotany, work with specific species of the precontact native flora thought to have been used and cultivated by the native Americans. Information is requested on Chenopodium bushianum Aellen. and Polygonum erectum L. Regional information on sightings of these plants and plant and fruit specimens are needed -- enough fruit, if possible 2-6 tablespoons, to allow experimental charring. They can be contacted at Department of Anthropology, Washington University, Lindell and Skinker, St. Louis, MO 63130.

Note from Missouri Dept. of Natural Resources

This past August, The Nature Conservancy purchased a 58-acre parcel of land near Roaring River State Park and this has since been acquired by the Missouri Department of Natural Resources for state park purposes. It represents a key addition to Roaring River State Park and includes an example of the White River glades feature. Almost half of the tract is glade opening surrounded by cedar and oak forest. Several characteristic plants occur here including Trelease's Larkspur, Ashe's Juniper, and Centaury Plant.

- Greg F. Iffrig
Natural Areas Coordinator

Omission

Central Missouri State University's Herbarium was mistakenly left out of the Missouri Herbaria list in Missouriensis 5(1). It should be inserted as follows:

Central Missouri State University (WARM) 16,000
Biology Dept.
Warrensburg, MO 64093

Curator: Dr. David Castaner; Carex (Cyperaceae).
Assistant: Donna Burchell.

Comments: Emphasis on North American Carex (about 6000 specimens); Missouri flora; various local flora vouchers such as Knob Noster State Park, Taberville, and Schell-Osage.

Note

Contributions on people, upcoming events, etc., of interest to MONPS members are welcomed by the editors.

MISSOURI'S INTERESTING FLORA: Pink Thoroughwort

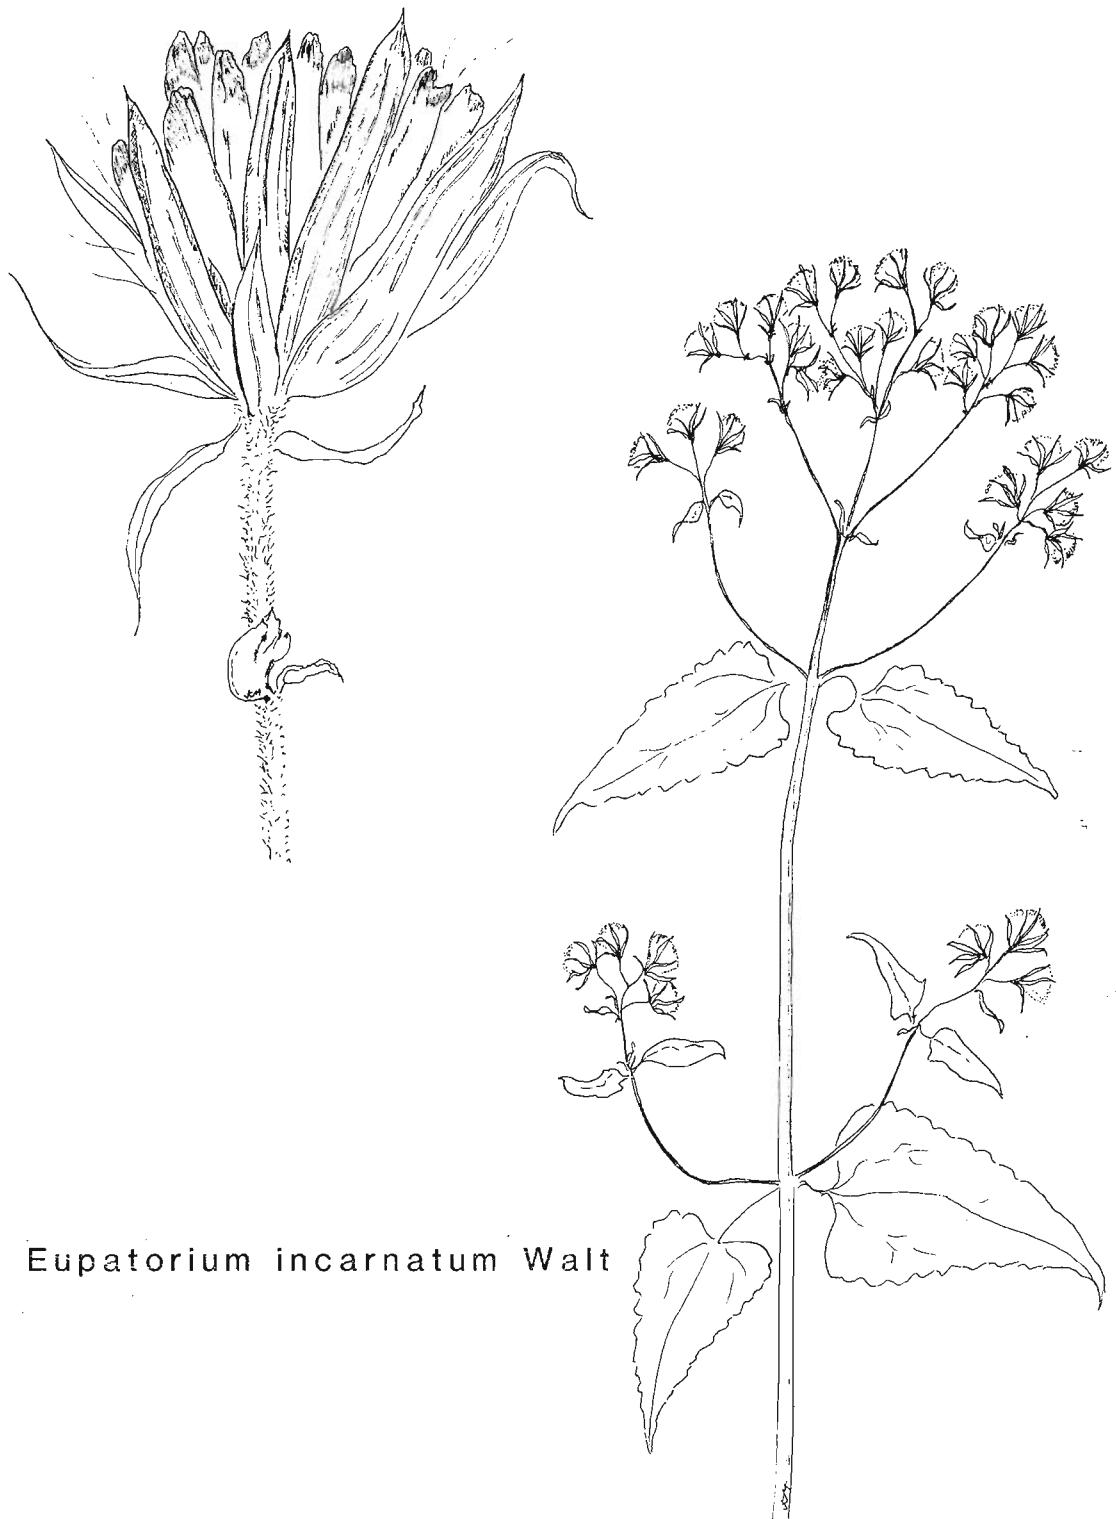

Art Christ¹

Eupatorium incarnatum Walt. (Pink Thoroughwort) is a rare species of the southeastern Missouri lowlands. We first found this species near the Holly Ridge Preserve area along the St. Louis-Southwestern railroad tracks on September 25, 1980. It resembles Eupatorium coelestinum L. (Mist-flower or Wild Ageratum), but Eupatorium incarnatum Walt. has pink or lilac flowers instead of blue or lavender flowers. The leaves of Eupatorium incarnatum Walt. are thinner, darker green, and generally more heart-shaped at the base than those of Eupatorium coelestinum L.

Eupatorium incarnatum Walt. has downy, loosely branched, and often reclining or straggling stems that are from two to four feet long. Its opposite leaves are rather triangular in outline, long-pointed at the tips, are three-quarters to two and a quarter inches long, and have slender stalks. The flower clusters are on slender branches that arise from many of the axils of the stems, while the tubular flowers number about twenty in each head.

This species grows in open sandy woods and in swampy places. It flowers between August and October. When the plant dries it has a fragrance resembling vanilla. It is found from Virginia to Ohio, Illinois and Missouri, south to Florida and Arizona.

Eupatorium incarnatum belongs to Compositae or Asteraceae (Composite Family). The generic name "Eupatorium" is dedicated to Mithridates Eupator, 132-63 B.C., who is said to have used a species of the genus in medicine, while the specific name "incarnatum" means flesh-colored.

Eupatorium incarnatum Walt

Further Notes on Some Missouri Rare & Endangered Plants

Steve L. Orzell¹

While conducting natural area inventories from 1980 through 1983, I encountered several previously unreported stations for Missouri taxa listed by the Missouri Department of Conservation (1984). Many of these also represent new county records and a few were previously reported (Orzell & Wallace, 1983a & b). The following is a listing of some additional discoveries. Specific site locations have been omitted from this paper, but have been forwarded to the Missouri Department of Conservation. Voucher specimens are to be deposited at the Missouri Botanical Garden. Nomenclature follows Steyermark (1963).

Anemone cylindrica A. Gray

Thimbleweed (Ranunculaceae) is reported from loess hill prairies in four northwestern Missouri counties (Steyermark, 1963). A recent natural area inventory of loess hill prairies (Iffrig, 1983) failed to locate any extant populations. A few fruiting plants were located scattered along the ridge crest of a loess hill prairie in Atchison and Holt counties, but no other stations were encountered for this plant, listed as rare (MDC, 1984). 12 September 1983, Orzell & Raveill 1170.

Aralia nudicaulis L.

Wild Sarsaparilla (Araliaceae) is listed as endangered (MDC, 1984). A new station was located in Pike County at the base of a northeast-facing limestone bluff. Plants grew in talus broken loose from the adjoining bluff in bare, partially shaded well-drained soil. Associates included Acer saccharum Marshall, Staphylea trifolia L., Sanguinaria canadensis L., Smilacina racemosa (L.) Desf., Parthenocissus quinquefolia (L.) Planchon, Aquilegia canadensis L., Oxalis stricta L. and Galium sp. No specimen collected, observed on 24 July 1981.

¹Arkansas Natural Heritage Commission, Suite 200, The Heritage Center, 225 East Markham Street, Little Rock, Arkansas 72201

Aster puniceus L. var. firmus (Nees) T. & G. forma lucidulus (A. Gray)
Fern.

Glossy-leaf Aster (Asteraceae) is on the watch list (MDC, 1984). Since numerous new stations were located, only one noteworthy collection is reported. A pink flowered form was collected from St. Francois County, 26 September 1981, Orzell 477. Here the plants thrive in a calcareous seep fen.

Campanula aparinaoides L.

Marsh Bellflower (Campanulaceae) is listed as endangered (MDC, 1984). Two new stations were located in Reynolds County. C. aparinaoides is abundant in a calcareous seep fen associated with Carex lurida Wahlenb., Juncus effusus L., Scirpus atrovirens Willd., Solidago patula Muhlenb., Mimulus ringens L., Viola cucullata Aiton, Cirsium muticum Michaux, Aster puniceus L. and Thelypteris palustris Schott. 31 July 1982, Orzell 800. Another new Reynolds County station was from a prairie fen where C. aparinaoides was locally abundant with Glyceria striata (Lam.) A. Hitch., Scirpus atrovirens Willd., Thelypteris palustris Schott, and Carex torta Boott. 22 July 1982, Orzell 769. Both collections are of flowering plants.

Carex bromoides Willd.

This sedge (Cyperaceae) was reported by Christ (1980) as a new state record from Bollinger County. Two new stations, both in Wayne County, were recently discovered. At one station this species is very abundant in a deeply shaded forest, forming dense tussocks, associated with Corylus americana Walter, Osmunda regalis L., Athyrium filix-femina (L.) Roth, Carex crinita Lam., Impatiens capensis Meerb., Solidago patula Muhlenb., and the moss Climacium americanum Brid., 18 June 1983, Orzell 1016. Associates at the other Wayne County station include Acer rubrum L., Fraxinus pennsylvanica Marshall, Alnus serrulata (Aiton) Willd., Carex lurida Wahlenb., Solidago patula Muhlenb., Scirpus polyphyllus Vahl, and Juncus effusus L. 18 June 1983, Orzell 1010. Carex bromoides was observed flowering on April 19, 1983. It is listed as status undetermined (MDC, 1984).

Carex stricta Lam. var. strictior (Dewey) Carey

This sedge (Cyperaceae) is listed as rare (MDC, 1984). Six new stations were located (2 in St. Francois County, 2 in Dent County, 2 in Reynolds County), all in Ozark fen communities. 23 May 1982, Orzell 496, 497; 29 May 1982, Orzell 518; 23 May 1983, Orzell 914; 3 June 1983, Orzell 959; 4 June 1983, Orzell 968; 9 June 1983, Orzell 984; and 29 May 1983, Orzell 940. This sedge is probably more frequent than is presently realized and will probably be discovered from additional fen sites.

Carex trichocarpa Schk.

Listed as rare (MDC, 1984), this species (Cyperaceae) was discovered at a new Reynolds County station in a prairie fen. It is locally abundant, associated with Silphium terebinthinaceum Jacq., Pycnanthemum virginianum (L.) Durand & Jackson, Juncus effusus L., Rudbeckia fulgida Aiton, Aster novae-angliae L., Carex suberecta (Olney) Britton, and Carex stricta Lam. var. strictior (Dewey) Carey. Fruiting occurs from late May to mid-June. 5 August 1982, Orzell & Nelson 843; 29 May 1983, Orzell 942; 3 June 1983, Orzell 960.

Cypripedium reginae Walter

A new station was located for the Showy Lady-slipper (Orchidaceae) in a series of calcareous seep fens in Shannon County. Approximately 96 stems of C. reginae occur with Parnassia grandifolia DC., Rudbeckia fulgida Aiton, Scirpus atrovirens Willd., Satureja arkansana (Nutt.) Briq., Spiranthes lucida (H. Eaton) Ames, and Senecio aureus L. 21 June 1982, Orzell 875. Cypripedium reginae is listed as rare (MDC, 1984).

Eupatorium cuneifolium Wild. var. semiserratum (DC.) Fern. & Griscom

Thoroughwort (Asteraceae) is on the watch list (MDC, 1984). A new station was located in a semi-open bottomland forest in Stoddard County. Associates included Quercus phellos L., Carya tomentosa Nutt., Ilex decidua Walter, Aster vimineus Lam., Hymenocallis occidentalis (Le Conte) Kunth, and Pycnanthemum muticum (Michaux) Pers. 8 August 1983, Orzell & Christ 1083

Filipendula rubra (Hill) Robinson

Queen of the Prairie (Rosaceae) is listed as endangered (MDC, 1984). A new station was located in St. Francois County in a calcareous seep fen. Associates include Carex stipata Willd., Carex stricta Lam. var. strictior (Dewey) Carey, Aster novae-angliae L., Pycnanthemum virginianum (L.) Durand & Jackson, Rudbeckia fulgida Aiton, Salix caroliniana Michaux, Oxypolis rigidior (L.) J. Cottier & Rose, and Glyceria striata (Lam.) A. Hitchc. It should be noted that this station lies east of the St. Francois State Park station located some years ago by the Webster Groves Nature Study Society. 31 July 1983, Orzell 1068.

Habenaria clavellata (Michaux) Sprengel (Platanthera clavellata (Michaux) Luer

Two new Wayne County stations are reported, both from deep shaded seep forest, for the Green Wood Orchid (Orchidaceae). H. clavellata occurs

on thick mossy hummocks of Thuidium delicatulum (Hedwig) B.S.G. and Climacium americanum Brid. Solidago patula Muhlenb., Impatiens capensis Meerb., and Carex bromoides Willd. are common associates at one Wayne County station. 18 June 1983, Orzell 1021. Hundreds of plants thrive on Sphagnum sp. - Thuidium delicatulum - Climacium americanum hummocks formed around the base of Acer rubrum L. or Alnus serrulata (Aiton) Willd. 28 May 1983, Orzell 925. The majority of plants remained sterile and few produced flowers in 1983. This orchid is listed as endangered (MDC, 1984).

Liparis loeselli (L.) Rich.

Loesel's Twayblade (Orchidaceae) is an endangered orchid (MDC, 1984) reported from Shannon, Carter, and Bollinger counties (Summers, 1981). Four new stations in Carter, Bollinger, Shannon, and Madison counties were discovered.

The newly located Carter County station is in a calcareous seep fen complex in a remote watershed. There are two populations of L. loeselli. One population thrives in full sun along a spring branch with Parnassia grandifolia, DC., Oxypolis rigidior (L.) J. Coulter & Rose, Carex hystericina Willd., Helenium autumnale L., Carex leptalea Wahlenb., and Rudbeckia fulgida Aiton. The other population thrives in partial shade on quaking mucky peat with copious seepage, associated with Impatiens capensis Meerb., Blyeria striata (Lam.) A. Hitchc., Carex laevigata (Kük.) Mackenzie., Carex lurida Wahlenb., and Senecio aureus L. 17 June 1983, Orzell 994.

The new station in Bollinger County is in a sedge shrub fen. Associates included Alnus serrulata (Aiton) Willd., Salix sericea Marshall, Cornus obliqua Raf., Carex leptalea Wahlenb., Ludwigia alternifolia L., Carex lurida Wahlenb., Solidago patula Muhlenb., Solidago riddellii Frank, Rudbeckia fulgida Aiton, and Pycnanthemum virginianum (L.) Durand & Jackson. 28 May 1983, Orzell & Wilhelm 924.

At the new Shannon County station L. loeselli occurs on the lower portion of a (hanging) calcareous seep fen. Rudbeckia fulgida Aiton, Carex leptalea Wahlenb., Scirpus atrovirens Willd., Hydrangea arborescens L., Satureja arkansana (Nutt.) Briq., Cypripedium reginae Walter, and Eupatorium perfoliatum L., are associates. No specimen collected, photographed on 19 July 1983.

The Madison County station is a new county record, from a sedge shrub fen. Associates were Salix sericea Marshall, Carex suberecta (Olney) Britton, Carex interior L. Bailey, Carex lanuginosa Michaux, Carex leptalea Wahlenb., Rudbeckia fulgida Aiton, Senecio aureus L., Eupatorium perfoliatum L., Pedicularis lanceolata Michaux, Boehmeria cylindrica (L.) Sw. var. drummondiana Wedd., Chelone glabra L., Scirpus atrovirens Willd., Oxypolis rigidior (L.) J. Coulter & Rose, Agrimony parviflora Aiton, Dulichium arundinaceum (L.) Britton, and Onoclea sensibilis L. 28 May 1983, Orzell & Wilhelm 920.

Peltandra virginica (L.) Schott & Endl.

Arrow Arum (Araceae) is listed as rare (MDC, 1984). A single robust plant of P. virginica was located in standing water of a roadside drainage ditch in Stoddard County. Aquatic associates included Lemna valdiviana Philipp, Azolla mexicana Presl, Polygonum hydropiperoides Michaux, and Ludwigia palustris (L.) Elliott. A single leaf and fruit serves as a voucher 3 August 1983. Orzell & Christ 1084.

Phlox maculata L. var. pyramidalis (Smith) Wherry

Seven new stations were located for Meadow Phlox (Polemoniaceae), considered rare (MDC, 1984). Six were in Reynolds County and one in Washington County. Phlox maculata most frequently associates with Carex vulpinoidea Michaux, Rudbeckia fulgida Aiton, and Pycnanthemum virginianum (L.) Durand & Jackson. In Missouri it is entirely restricted to fens in the southeastern Ozarks. Flowering has been recorded from July 11 through September 24, peaking July 15 - August 16 in most fens. Some of the material collected exhibited noteworthy phenotypic variation; a white-flowered form (Orzell 348), pink-flowered form (Orzell 812), and a form with a white inner corolla tube and lacking stem maculation (Orzell 729). None of these forms was previously known in Missouri.

Plantago cordata Lam.

Heart-leaf Plantain (Plantaginaceae) is on the Missouri watch list (MDC, 1984). This plant is a Category II species currently under review for possible federal listing as either a federally threatened or endangered species (U.S. Department of Interior, 1983). Eleven new stations were located (8 in Reynolds County, 2 in Carter County, and 1 in Dent County) along calcareous seep-fed streams or seep springs in fens. The largest population noted was along a remote high-quality calcareous seep-fed stream in Carter County where thousands of robust plants occur in dense stands. Flowering occurs from mid-April to early May. Not all of the sites are represented by vouchered material. 30 June 1982, Orzell 626; 26 April 1983, Orzell 880; 9 June 1983, Orzell 985; 17 June 1983, Orzell 995.

Pycnanthemum muticum (Michaux) Pers.

Mountain Mint (Lamiaceae) is listed as rare (MDC, 1984). Plants were occasional in a semi-open bottomland forest in Stoddard County, with Quercus phellos L., Carya tomentosa Nutt., Ilex decidua Walter, Eupatorium cuneifolium Willd. var. semisseratum (DC.) Fern. & Griscom, Hymenocallis occidentalis (LeConte) Kunth, and Aster vimineus Lam. 8 August 1983, Orzell & Christ 1079.

Scleria verticillata Willd.

Nut-rush (Cyperaceae) is on the watch list (MDC, 1984). Four new stations were located (1 in St. Francois County, 1 in Reynolds County, 1 in Shannon County and 1 in Washington County). All collections were from marly (calcareous ooze) areas in Ozark fens. Associates frequently included Satureja arkansana (Nutt.) Briq., Rhynchospora capillacea Torrey, Rudbeckia fulgida Aiton, Parnassia grandifolia DC., Panicum flexile (Gattinger) Scribner, Lysimachia quadriflora Sims, and often Fuirena simplex Vah. 9 August 1981, Orzell 367; 4 August 1981, Orzell 835; 12 August 1982, Orzell 846; 24 September 1983, Orzell 1199.

Sullivantia renifolia Rosend.

S. renifolia (Saxifragaceae) was located at two new stations in Jefferson County and one in Franklin County. The Franklin County station was along a north-facing sandstone bluff of the Roubidoux formation (Ordovician age) near Moselle, several miles from the Franklin County Steyermark station. Jefferson County stations were all on dripping wet St. Peter sandstone formations (Ordovician age): one along the Meramec River; the other from a series of shelter caves near Clubmoss Hollow (a former Steyermark station). 25 June 1980, Orzell 225; 16 July 1980, Orzell 226; 21 July 1980, Orzell 229.

Syphoricarpos occidentalis Hook.

Wolfberry (Caprifoliaceae) is listed as endangered (MDC, 1984). Several plants were located along a railroad right-of-way in Nodaway County. Associates included Solidago graminifolia (L.) Salisb., Helianthus grosseserratus Martens, Setaria faberii Herrm., Asclepias syriaca L., Ambrosia trifida L., and Muhlenbergia sp. 11 September 1983, Orzell & Raveill 1169.

The Spirit of Wildflower Gardening

Paul Nelson¹

Just less than 200 years ago, Missouri's 44 million acres of land provided habitat for a variety of wildflowers. Our European ancestors were enthralled by the state's scenery and wildflower spectacles. Since the time of settlement, we have witnessed rapid alteration of the fabric of delicate plant communities. Indeed, looking today at what remains, one finds it hard to grasp the concept of the original landscape and its varied wildflowers. One can now drive thousands of miles in Missouri only to see mosaics of fescue, corn, soybeans, weedy depleted pastures, reservoirs, stripped land, and urban sprawl.

The mere cameos of our presettlement wildflower landscapes which still exist are places of special importance to us. So valuable to us are these special remnants of original landscape that they form part of our heritage. We especially recognize the scientific value in preserving the purity of natural areas set aside in state parks, wildlife refuges, forest service property, scenic riverways, and on the properties of private individuals.

We so cherish the value of our wildflower heritage that, in recent years, we have encouraged our members and the general public to capture this beauty in wildflower gardens. As one who appreciates this heritage, and cannot always visit these special places away from home to see wildflowers, I have planted a backyard wildflower garden. In fact, I'm sure its the only one in Loose Creek! With so many new members now considering establishing wildflower gardens, I would like to reinstate several points considered in past years by the Society:

- 1) Do not transplant or seed native wildflowers or plants in natural habitats where the plants can spread uncontrolled. This is especially critical in scientifically valuable natural areas, state parks, or other lands where native assemblages of plants can still be studied or preserved. Remember, these cameos of natural habitat are the purest, most precious remnants of our natural heritage left.
- 2) When considering native plants, be sure to use seed sources or plantings known only from your local area. The seed of bloodroot or blue-eyed Mary collected in Tennessee and planted in

¹Department of Natural Resources, P. O. Box 176, Jefferson City, Missouri 65101.

northern Missouri does not produce the exact genetic plants found locally. You should investigate the source of plant material listed in seed catalogues.

3) Good sources of plant material come from salvage operations. I collected wildflowers from a reservoir construction site where they were to be destroyed.

4) Remember the property rights of others. You must have permission to collect seed or dig plants on the land of other landowners. Wildflowers are protected on most public lands including state parks, wildlife refuges, Forest Service and National Park Service property.

5) Finally, remember good ethics in collecting or transplanting native plants. Our Society has developed policies regarding these ethics which were published in *Missouriensis**.

In the spirit of those ancestors first inspired by our wildflower heritage, let's garden with plants "wild" from "Missouri" and protect and appreciate those wild in our Missouri wilderness.

*Reference: *Missouriensis*; Spring, 1980. Volume 1, Number 4, pp. 2-3.

Wildflowers I Have Grown

Edgar Denison¹

Allium stellatum - Wild Onion. About 1 foot high, free flowering in fall. Seeds readily. Full sun. September - October.

Anemone canadensis - White Anemone. About 20" high, long-flowering, April through June. Spreads aggressively by stolons. Excellent border plant.

Aquilegia canadensis - Wild Columbine. About 2 feet tall, free-flowering in April/May. Aggressive spreader through seeds. Seeds germinate best immediately upon ripening.

Arisaema dracontium - Green Dragon. Light shade, easy from seed. Culture 1. To 3' tall, forms corms. Must be kept in check.

Arisaema triphyllum - Jack in the Pulpit. Similar in every respect to A. dracontium but not as aggressive. Flowers in April. Fruit of both species of Arisaema are brilliant red berries.

Asarum canadense - Wild Ginger. Best started from root cutting. Good ground cover, spreads rapidly. Shiny leaves; roots are a ginger substitute. Needs some shade.

Asclepias incarnata - Swamp Milkweed. To 6' tall, pink (rarely white) flowers, fragrant and showy. Spreads rapidly through seeds. Subject to infestation by yellow aphids. Attracts butterflies. Water during dry spells.

Aster oblongifolius - Oblong-leaf Aster. In contrast to its appearance in nature forms large, wide-spread clumps in garden. Very free-flowering in fall, to 2 1/2' tall. Self-seeds freely.

Aster novaeangliae-New England Aster. To 6 feet tall, in many color variants, free-flowering. Forms clumps which should be staked. Treat like Chrysanthemums and pinch back repeatedly until late August. Full sun. Water when dry.

Campanula americana - Tall Bellflower. To 7' tall, wide branched, with many blue (rarely white) flowers. As in the wild, it needs water. Self-seeds profusely, prefers light shade. Probably a biennial.

Cassia marilandica - Wild Senna. Vigorous perennial to 8' tall, with many branches loaded with yellow, pea-flowers. Grows in the wild in varied habitats: on glades and in moist bottomlands. Seeds germinate readily.

Chelone obliqua - Rose Turtlehead. RARE, to 7' tall with fleshy roots. Does well in good soil when given water in summer. Seeds germinate readily (Culture 1). Even very small, young plants will set flowers.

Cimicifuga racemosa - Black Snakeroot. Shade-loving, to 7' tall. Showy, white racemes are long lasting in summer (June - July). Spreads by root division. Demands humus-rich soil and moisture.

Clematis fremontii - Fremont's Leather Flower. A glade dweller, which appeared on an imitation mini-glade in my garden and has persisted. Drainage paramount requirement, soil secondary. Flowers in April. This is a non-climbing Clematis.

Collinsia verna - Blue-eyed Mary. Annual, about 10" high. Seeds germinate in late fall and stay green through the winter as seed-leaves (cotyledons). Will carpet entire garden if permitted. Excellent companion to tulips and narcissus. Blooms in April.

Dicentra cucullaria - Dutchman's Breeches. To 15" high in shade, with perfect drainage (never on level ground) and humus-rich soil. Flowers in April. Corms can be divided.

Dicentra canadensis - Squirrel Corn. Similar to preceding. Does not tolerate sun. Needs perfect drainage on a hill.

Dodecatheon meadia - Shooting Star. This is a report of a failure. Germinates readily but will not tolerate transplanting. Seed where it is to grow. Being both a prairie and a glade dweller D.C. should not be a difficult subject.

Filipendula rubra - Queen of the Prairie. RARE, found in very moist situations. Does very well under garden conditions with supply of moisture during dry periods. To nearly 7' tall with magnificent clusters of pink flowers from late June to August. Must be divided about every 3 years or will exhaust soil. Full sun or light shade.

Gentiana alba - Pale Gentian (formerly G. pallida). Very RARE. Good germination from seed collected in Warren County. To 2' tall, large white flowers in terminal clusters. Limestone habitat, but protected from afternoon sun by Junipers. Culture 1. Flowers in September.

Gentiana andrewsii - Closed Gentian (formerly G. clausa). Readily grown from seeds and self-seeds. Prefers light shade and moist habitat. Spectacular purple and blue floral clusters in September/October on 18" stems. Subject to a fungal disease, causing withering. Primarily a rock garden species.

Geranium maculatum - Wild Geranium, Crane's Bill. Woodland dweller demanding shade and rich humus. Spreads readily from seeds. Aggressive plant with rose to magenta flowers in April/May.

Heterotheca latifolia - Golden Aster. A composite but NOT an Aster. Easy from seed. Many flowers on much branched plants to 3' tall, yellow, in September. Full sun.

Iris fulva - Copper Iris. Though at home in southern Missouri does very well in central parts. To 3' tall with light brown to copper color blossoms. Rich soil and ample moisture (grows normally in ditches and sloughs). Roots must be divided occasionally.

Iris virginica - Southern Blue Flag. About 3' tall, easy from seed. Needs ample water during dry times. Roots spread. Flower color very variable from palest purple to deep and (very rare) almost white. Short flowering season in June.

Iris cristata - Crested Iris. A low growing Iris of rich valleys and slopes. Tolerates open shade well (may even like it!). Spreads through rhizomes into large groups. Flowers in April.

Iris brevicaulis - Short-stemmed Iris. Quite RARE near sloughs and flowing water, but always with excellent drainage. Flowers low but very large and variable in color light to deep purple. Foliage tall to 2½' hides flowers. Seed germination easy.

Lithospermum latifolium - (no common name). A perennial, shrub-like relative of the Hoary Puccoon. RARE, with insignificant flowers, grown as a curiosity. Has no garden value.

Lobelia cardinalis - Cardinal Flower. Tall dwellers of stream borders do well in rich soil if given water during dry season. To 6' tall with cardinal-red spikes of flowers from July to September. Easy from seed. Forms rosette 1st year and blooms during 2nd.

Lobelia siphilitica - Great Blue Lobelia. Found in creek bottoms and other wet situations. To 2' tall (occasionally much taller!) with blue or purple flowers, rarely white, blooms August - September. Difficult to get started but quite vigorous once established.

Mertensia virginica - Blue bells. In nature only in bottomlands, but an excellent garden subject in rich soil. Flowers light blue and pink in April. As foliage disappears in June their place of growth should be marked. The roots look like old leather very unroot-like. About 2' tall.

Mimulus alatus - Monkey Flower. Habitat: wet places. Much branched plant with lavender flowers during summer. Very aggressive in garden through self-seeding. To 3' tall.

Monarda fistulosa - Wild Bergamot. Of easiest culture, spreading through roots, to 3' tall with pink flowers, which attract butterflies. Highly aromatic foliage. The well-known M. didyma with brilliant red flowers is NOT native to Missouri. Flowers in summer. The earlier flowering M. russeliana is paler.

Nemastylis geminiflora - (Steyermark gives no common name). A beautiful member of the Iris family to 1' tall with lavender flowers. They are incredibly deep rooted, often in sticky clay, and demand excellent drainage. Full sun. Need a dry season in summer. Do not dig, try seeds planted immediately on ripening.

Oenothera macrocarpa - Large-fruited evening Primrose. This glory of our glades (formerly named O. missouriensis) grows well in gardens if near-glade conditions are provided, i.e. lots of rubble, little soil, perfect drainage. It can bloom itself to death. Huge, lemon-yellow flowers open during afternoon in May and June. Do not water in summer. About 1' tall.

Oenothera triloba - Evening Primrose (no specific common name). RARE in Missouri. Needs poor soil with good drainage. Flowers large, but smaller than O. macrocarpa open in 2-3 seconds at dusk and are usually closed by daybreak. Foliage dandelion-like. Full sun. About 9" tall.

Polygonatum canaliculatum - Solomon's Seal. Easy from root division. Tolerant to soil and situation, either sun or open shade. To 3' high with small bells hanging from nodes. Can be very aggressive in garden.

Rudbeckia triloba - Brown-eyed Susan. I have grown selected stock from a plant, found in the wild, which has a deep-red center of the normally yellow ray florets. Makes a very showy "bush" to 4' tall under garden conditions. Many small inflorescences over a long period in fall.

Sanguinaria canadensis - Bloodroot. Easily grown from corms. Flowers short-lived in early spring with irregular number of petals. Shade in rich soil.

Silene regia - Royal Catchfly. FAIRLY RARE in dry situations, often in light shade. Tall, to 3½' with many brilliantly red flowers, which resemble the also native Firepink. Easy from seed when first stratified. Very long-flowering perennial.

Silene virginica - Firepink. Low plants to 18" with brilliantly red flowers in April and sometimes later. Want shade, rich soil and no competition. A plant of woodland borders.

Sisyrinchium campestre - Blue-eyed Grass. A glade dweller, which, however, thrives on better soil. To 1' tall with many small, blue flowers and very narrow leaves. It will take over any rock garden if permitted through copious seeding.

Spigelia marilandica - Pinkroot. A RARE plant of Ozark stream bottoms. Does very well in garden soil if protected from noon and afternoon sun. About 18" high with many tubular flowers in late May, brick red on the outside and yellow on the inside. Has never seeded. The seeds disappear during night and can only be saved by wrapping each stem. Quite showy, divides well after forming large clumps.

Stylophorum diphyllum - Celandine Poppy. Do not confuse with the European Celandine Poppy, which has small, insignificant flowers. Low, dense plants, about 15" high with beautiful, blue-green foliage and large, yellow blossoms in April. Like open shade, but tolerate some sun. Seeds profusely on humus-rich soil. Under garden conditions flowering is extended through mid-summer.

Talinum calycinum - Rock Pink. Not a "Pink" but a member of the Portulaca Family. Plant on raised surface (rock-garden) in rubble and sand. Forms small, fleshy rosettes from which arise pencil-line thin flowering stalks with cherry-pink flowers in June/July. Rhizomatous roots. Flowers open around noon each day. Ca 8" high.

Verbena canadensis - Rose Verbena. Low growing, creeping, an indicator of poor soil. Flowers off and on all through spring and summer in variable shades from pink to purple. Easiest culture.

Viola species - Violets. With exception of V. pedata, Birdsfoot Violet, the other common species are of easiest culture and readily raised from ripe seed. As all violets (with exception of V. pedata) produce seeds all through the season from unfertilized flowers (cryptogamous) the supply of seeds is no problem. Common species are: V. pensylvanica - yellow; V. striata - white; V. papilionaceae, V. sororia, viarum, sagittata, triloba - violet.

V. papilionaceae f. albiflora, the so-called Confederate Violet, is a white and violet form much seen in gardens.

V. pedata - Birdsfoot Violet. In many trials I have never been able to keep plants more than 2 years. It demands perfect drainage in a rocky soil with full sun or partial shade.

Note: All plant species mentioned are NATIVES of Missouri. There are, of course, many more native Missouri species which can be grown in gardens. Due to lack of space I have never worked with the large composites (Helianthus, Silphium, Heliopsis, Rudbeckia), many of which would be stunning additions to gardens. Nor have I experimented with the large tribe of Goldenrod (Solidago), of which lately a number appear in catalogues as worthy of garden space.

Culture 1 - Stratify seeds over winter, i.e., spread them on a layer of sand, cover lightly, and expose to freezing and thawing. It is desirable to protect the stratified seed so that heavy rain will not wash out the seeds. Cover seeds with old screening wire or hardware cloth to keep birds and rodents from eating the seeds. Seeds should germinate in spring, though a number of plants have a seed dormancy of 2 (or more) years.

WHAT'S NEW IN MISSOURI? II

Missouri Botanical Garden
St Louis, MO 63166

This is the second installment of a regular column designed to rapidly disseminate post-Steyermark Missouri state records. Our first installment (see *Missouriensis* 5(1) generated welcome feedback; we encourage further comments on content and arrangement of data.

The names presented here are those that we consider currently acceptable. If no consensus exists in the primary literature, opposing viewpoints will be noted. Where nomenclature differs from Steyermarkian usage synonyms are included. Explanatory notes are added as needed.

Albizia julibrissin Durz. (FABACEAE = LEGUMINOSAE) Thompson 1980: 194.
Arabis glabra L. (BRASSICACEAE = CRUCIFERAE) Mohlenbrock 1980: 14.
Asplenium montanum Willd. (POLYPODIACEAE) Key 1982: 152; Key & Redfearn 1973: 1-2.

Beta vulgaris L. (CHENOPodiaceae) Mühlenbach 1969: 165.
Brassica napus L. (BRASSICACEAE = CRUCIFERAE) Mühlenbach 1983: 172.
Brassica oleracea L. (BRASSICACEAE = CRUCIFERAE) Mühlenbach 1983: 172.

Carex crawfordii Fern. (CYPERACEAE) Mühlenbach 1983: 171; see also Hermann 1970.

Chasmanthium sessiliflorum (Poir.) Yates (Uniola sessiliflora) (POACEAE = GRAMINEAE) Yates 1966: 428.

Cicuta maculata L. var. bolanderi (S. Wats.) G.A. Mulligan (Cicuta bolanderi) (APIACEAE = UMBELLIFERAE) Mulligan 1980: 1766.

Dichanthelium sabulorum (Lam.) Gould & Clark var. thinum (A.S. Hitchc. & Chase) Gould & Clark (Panicum columbianum) (POACEAE = GRAMINEAE) Weber 1982: 58.

Dodecatheon frenchii (Vasey) Rydb. (PRIMULACEAE) Nelson 1979a: 7-8.

Echinochloa utilis Ohwi & Yabuno (POACEAE = GRAMINEAE) Mühlenbach 1983: 171; Yabuno 1966: 319; Ohwi 1962: 50. Note: new to North America?

Equisetum X ferrissii Clute (EQUISETACEAE) Key 1982: 52. Note: distribution based on collections at MO.

Eragrostis secundiflora Presl. subsp. oxylepis (Torr.) S.D. Koch (Eragrostis oxylepis or E. secundiflora) (POACEAE = GRAMINEAE) Koch 1974: 397; Mühlenbach 1969: 165.

Eschscholtzia californica Cham. (PAPAVERACEAE) Steyermark 1963 (Supplement): 1652.

Galium divaricatum Poir. ex Lamark (RUBIACEAE) Castaner 1983: III; Dempster 1979: 12. Note: This taxa might eventually be lumped with G. parisiense L. Galium pedemontanum (Bellardi) All. (RUBIACEAE) Sanders 1976: 73-80.

Heliotropium curassavicum L. (BORAGINACEAE) Nelson 1979b: 246-247.

Ipomoea trichocarpa Ell. (CONVOLVULACEAE) Austin 1978: 125. Note: localities were not cited in this reference.

- Lactuca sativa L. (ASTERACEAE = COMPOSITAE) Mühlenbach 1983: 172.
- Parthenocissus tricuspidata (Sieb. & Zucc.) Planch. (VITACEAE) Mühlenbach 1969: 167.
- Pisum sativum L. (FABACEAE = LEGUMINOSAE) Mühlenbach 1969: 167.
- Plantago patagonica Jacq. (PLANTAGINACEAE) Rahn 1978: 149. Note: localities were not cited in this reference.
- Plantago wrightiana Dcne. (PLANTAGINACEAE) Steyermark 1963(Supplement): 1653.
- Salix X rubens Schrank (Salix alba X S. fragilis) (SALICACEAE) Mühlenbach 1983: 171; Kartesz & Kartesz 1980: 427.
- Selaginella eclipses Buck (SELAGINELLACEAE) Buck 1977: 366-371; Redfearn 1982: 16-17. Note: See corrected map for S. apoda.
- Smilax illinoensis Mangaly (SMILACACEAE split from LILIACEAE) Steyermark 1963(1968 Errata): 1727; Mangaly 1968: 263-264.
- Symporicarpos albus (L.) Blake (CAPRIFOLIACEAE) Mühlenbach 1983: 172.
- Torilis arvensis (Huds.) Link (APIACEAE = UMBELLIFERAE) Mühlenbach 1969: 168.
- Viola arvensis Murray (VIOLACEAE) Mühlenbach 1983: 172.

ERRATA

1. Alliaria officinalis is now Alliaria petiolata (Bieb.) Cavara & Grande
Tutin et al., eds. 1964: 267; Patman & Iltis 1961: 42; Smith 1978: 123.
2. Bothriochloa bladhii (Andropogon intermedia) Allred & Gould 1983: 168-184.
3. The following are family names for plants discussed in the previous issue:

<u>Aeschynomene</u> = FABACEAE/GRAMINEAE	<u>Fumaria</u> = FUMARIACEAE
<u>Aira</u> = POACEAE/GRAMINEAE	<u>Gaura</u> = ONAGRACEAE
<u>Alliaria</u> = BRASSICACEAE/CRUCIFERAE	<u>Geum</u> = ROSACEAE
<u>Alyssum</u> = BRASSICACEAE/CRUCIFERAE	<u>Gossypium</u> = MALVACEAE
<u>Artemisia</u> = ASTERACEAE/COMPOSITAE	<u>Gutierrezia</u> = ASTERACEAE
<u>Asclepias</u> = ASCLEPIADACEAE	<u>Ipomoea</u> = CONVOLVULACEAE
<u>Atriplex</u> = CHENOPODIACEAE	<u>Juncus</u> = JUNCACEAE
<u>Aubrieta</u> = BRASSICACEAE/CRUCIFERAE	<u>Lepidium</u> = BRASSICACEAE
<u>Bothriochloa</u> = POACEAE/GRAMINEAE	<u>Lonicera</u> = CAPRIFOLIACEAE
<u>Bromus</u> = POACEAE/GRAMINEAE	<u>Lychnis</u> = CARYOPHYLLACEAE
<u>Brunnera</u> = BORAGINACEAE	<u>Mentzelia</u> = LOASACEAE
<u>Centaurea</u> = ASTERACEAE/COMPOSITAE	<u>Oenothera</u> = ONAGRACEAE
<u>Ceratostigma</u> = PLUMBAGINACEAE	<u>Ophioglossum</u> = OPHIOGLOSSAC.
<u>Chenopodium</u> = CHENOPodiACEAE	<u>Paspalum</u> = POACEAE
<u>Coreopsis</u> = ASTERACEAE/COMPOSITAE	<u>Pennisetum</u> = POACEAE
<u>Crepis</u> = ASTERACEAE/COMPOSITAE	<u>Philadelphus</u> = SAXIFRAGAC.
<u>Croton</u> = CHENOPODIACEAE	<u>Physalis</u> = SOLANACEAE
<u>Cucurbita</u> = CUCURBITACEAE	<u>Prunus</u> = ROSACEAE
<u>Cynosurus</u> = POACEAE/GRAMINEAE	<u>Ratibida</u> = ASTERACEAE
<u>Cyperus</u> = CYPERACEAE	<u>Reseda</u> = RESEDACEAE

<u>Desmodium</u> = FABACEAE/LEGUMINOSAE	<u>Salsola</u> = CHENOPODIACEAE
<u>Dipsacus</u> = DIPSACACEAE	<u>Sclerochloa</u> = POACEAE
