MISSOURIENSIS

JOURNAL OF THE
MISSOURI NATIVE PLANT SOCIETY

Published for the Society
At
Southwest Missouri State University, Springfield

CONTENTS

Missouriensis is the official publication of the Missouri Native Plant Society. Founded in 1979 as a non-profit corporation, the Society is devoted to the conservation and study of the plants growing wild in Missouri, to the education of the public about the significance of the native flora and its habitat, and to the publication of related information.

STUDIES IN THE FLORA OF MISSOURI, II.

George Yatskievych
Flora of Missouri Project
Missouri Botanical Garden
P. O. Box 299, St. Louis, MO 63166

The following species have been identified as new to Missouri since the first installment of this series was published (Yatskievych and Figg, 1989). They are presented here to validate the presence of these plants in the state and to encourage botanists to locate other populations of these taxa.

Hypericum majus (A. Gray) Rusby (Clusiaceae) - The northern species, *Hypericum canadense* L., was reported for Missouri (Steyermark, 1963) far from its known range, based upon a single collection from Sullivan County (Steyermark 70133; F). This collection was not examined by the most recent student of this group (Webb, 1980). Using Webb's monograph, the specimen was studied and found to be *H. majus* (A. Gray) Rusby, a widespread, related taxon also known to occur in adjacent Iowa. Thus, *H. canadensis* should be deleted from the state's flora and replaced with *H. majus*.

Carex eleocharis L. Bailey (Cyperaceae) - The occurrence of this species Missouri was first noted by the eminent "cyperologist", Anton Reznicek, during his annotations of the F. J. Hermann herbarium at the time of its purchase by the University of Michigan some years ago. Hermann, himself a specialist in the study of *Carex*, had received the following collection for determination from Viktor Muhlenbach, but had been unable to determine it with confidence:

ST. LOUIS CITY: Bremen Avenue freight yard, between
Bremen Ave. and Angelica St., 26 May 1962, V. Muhlenbach
1951 (MICH, MO).

This collection was not included in Muhlenbach's (1979, 1983) subsequent treatments of the railroad flora in the St. Louis area and only recently resurfaced during Dr. Reznicek's work with the *Carex* collections at the Missouri Botanical Garden, where a duplicate was discovered.

Carex eleocharis is a member of the section *Divisae*, which includes two other Missouri species, *C. douglasii* Boott and *C. praegracilis* W. Boott. In general appearance and in Steyermark's (1963) key to *Carex* species, *C. eleocharis* comes closest to *C. praegracilis*, but differs in its smooth, obtusely angled (vs. triangular, roughened) culms, its thinner (1-2 vs. 2-6 mm thick) rhizomes, its involute (vs. flattened) leaves, and its more compact inflorescences. It grows natively from Alaska and Arizona eastward to Manitoba

and Kansas and occurs throughout much of the Great Plains (Kolstad, 1986). As such, it seems possible that native populations of this sedge will eventually be found in dry prairies and rocky or sandy areas in western Missouri.

Medicago minima (L.) Bartal. (Fabaceae) - This introduced species, commonly known as small bur clover or prickly medick, is sometimes planted for forage or green manure and is becoming established in the southern and southeastern United States. It resembles *M. arabica* (L.) Hudson and *M. polymorpha* L., already known from Missouri, in its habit, flowers, and spiny fruits, but differs from both of these species in its minutely dentate, rather than lacerate stipules (Small and Jomphe, 1989). A new record of this bur clover is documented by the following collection:

SCOTT COUNTY: disturbed roadside, just west of
Interstate 55 on Highway 62, Sikeston, 23 May 1989,
Yatskievych, Ladd, & Summers 89-92 (MO).

Myriophyllum spicatum L. (Haloragaceae) - The Eurasian water milfoil appears to be a relatively recent introduction that has dramatically expanded its range during the last few decades. Couch and Nelson (1986) provided a historical perspective on the broadening North American distribution of this species, the oldest documented collection of which dates back only to 1942. These authors first reported the species from four counties scattered in the southern half of Missouri, but did not cite voucher specimens in their overview. Since that time three collections at the Missouri Botanical Garden herbarium have been annotated as this species by Dr. Susan Aiken, a specialist in the genus *Myriophyllum*. Although the exact counties represented in Couch and Nelson's distributional maps are not possible to determine with any surety, the MO specimens obviously represent different collections. Thus, this species is more widespread in the state than the following collections indicate:

CARTER COUNTY: shallow water of the Current River,
south of Van Buren, 21 Sep 1980, *B. Summers 778.*

CRAWFORD COUNTY: cool water of the Meramec River,
2 mi upstream from Onandaga Cave, 16 Sep 1984,
B. Summers 1474.

MONTGOMERY COUNTY: submerged in deeper pools of old
artificial pond, along County Road BB, 0.2 mi west of
Highway 161 junction, 25 Aug 1985, *A. Brant &*
R. Gereau 694.

Myriophyllum spicatum is relatively easily separated from the other three species listed by Steyermark (1963) for Missouri. From *M. pinnatum* (Walter)

Britton, Sterns, & Pogg., it can be separated by its opposite to whorled (vs. at least some alternate) leaves. *Myriophyllum heterophyllum* Michaux differs in its larger, toothed (rather than shorter, dissected) bracts subtending the flowers, and *M. aquaticum* (Vell. Conc.) Verdc. [= *M. brasiliense* Cambess. in Steyermark (1963)] has longer (2.5-3.5 vs. <2.0 cm) emergent leaves with longer (4-8 vs. <4 mm) divisions. Other differences in the flower morphologies also exist (Aiken, 1981).

TWO NOTEWORTHY COLLECTIONS OF *OROBANCHE* L. (OROBANCHACEAE) FROM MISSOURI

Timothy E. Smith
Missouri Department of Conservation

The Section MYZORRHIZA of *Orobanche* L. is represented in Missouri by two taxa of uncertain nomenclature. Two collections in 1989 established that extant populations of both of these broomrapes occur within the state. The densely spicate inflorescences of taxa within Section MYZORRHIZA distinguishes them from *O. uniflora* Nutt. of the Section GYMNOCAULIS, the only other *Orobanche* known from Missouri. All members of the genus are achlorophyllous and parasitic on the roots of various vascular plants, particularly the Compositae. Steyermark (1963) recognized only *O. ludoviciana* Nutt. within Section MYZORRHIZA and cited only two collections, both from St. Louis County from the 1890s. A 1939 collection from McDonald County, near Pineville, was determined by its collector W. B. Drew to also be *O. ludoviciana*. None of the three collection sites is known to contain an extant population today. Because of a dearth of records, the Missouri Department of Conservation (Wilson, 1984) lists *O. ludoviciana* as a Missouri endangered species.

On June 20, 1989, I collected an *Orobanche* with a densely spicate inflorescence on a dolomite glade in southwestern Taney County (Smith 2903, MO). The specimen was identified as *O. multiflora* Nutt. using keys by Collins (Correll and Johnston 1970) and Van Bruggen (Great Plains Flora Association 1986). However, in an unpublished thesis by Collins (1973), the taxon is considered a subspecies of *O. ludoviciana*. Following Collins (1973 and pers. comm. 1989), my collection represents the easternmost site of a taxon that is widely distributed in the Great Plains. A recent inspection of the Drew specimen at UM by George Yatskievych (pers. comm.) indicated that the 1939 McDonald County record is apparently the same species as my Taney County collection. Since the McDonald County record contained only general location data, and the record is over fifty years old; the collection from Taney County is the only known extant site for the taxon in Missouri.

Following discussions with me and Dr. Collins, George Yatskievych searched for additional records of *Orobanche* in a suitable habitat in St. Louis County, where the two collections from the 1890s occurred. Amazingly, on his first attempt, Yatskievych located several plants on August 20, 1989 on the south bank of the Meramec River. The plants were determined to be parasitic on the roots of a large stand of Giant Ragweed, *Ambrosia trifida* L. The specimen (Yatskievych 89-320, MO) is best identified as *O. ludoviciana* according to area manuals (Steyermark 1963, Mohlenbrock 1986). Col-

lins (1973), in studying the nomenclature and typification of Section MYZORRHIZA, concluded that the name *O. ludoviciana* correctly applies to the more western taxon previously known as *O. multiflora*, rather than to the more eastern plants traditionally referred to as *O. ludoviciana*. He proposes the new taxon, *O. riparia* ined., for the plants of eastern Missouri, Illinois, and several other mid-western states. Unfortunately, because Collins' thesis remains unpublished, a valid new name for the eastern taxon does not yet exist.

Regardless of the eventual resolution of the taxonomic difficulties with Section MYZORRHIZA of *Orobanche*, the southwestern and eastern Missouri populations confirmed in 1989 should remain as separate species. The taxa differ in habitat and in host specificity. Morphologically, the eastern plants can be distinguished from western populations by their distinctly acute versus rounded, obtuse corolla lobes; more widely spaced flowers on much branched stems; and larger overall size (Collins 1973). For the present, it seems best to continue using the traditional nomenclature in this complex, i.e. *O. multiflora* for the southwestern Missouri plants and *O. ludoviciana* for the eastern Missouri plants. Future research should include locating additional populations of both taxa in the state and determining additional host species.

STENOTAPHRUM SECUNDATUM (POACEAE) IN STONE COUNTY. A NEW GRASS FOR MISSOURI

Linda S. Ellis
911 W. 48th St. #105
Kansas City, MO 64112

Stenotaphrum secundatum (Walter) Kuntze, commonly called St. Augustine grass, is a warm season turf grass that is widespread in the American tropics and as far north as coastal South Carolina. It is also grown extensively in lawns and has become established in Texas and California (Hitchcock, 1950).

Stenotaphrum, a Greek name meaning "narrow trench", describes perfectly the solitary or paired flowering spikelets, which are embedded in a fleshy rachis 10 to 30 cm tall. The vegetative portion has a compressed habit of branching, stoloniferous culms with short, obtusely tipped leaf blades usually less than 15 cm long (Fig. 1).

This grass was introduced as sod in 1961 to the site of Cedar Hollow Resort, owned by Harold H. Ellis, where it became established and persisted until the present. Cedar Hollow Resort is located on Table Rock Lake in southern Stone County, ca. 18 miles southwest of Reeds Spring and ca 40 miles north of the Arkansas border.

This site was first discovered by the author in a routine botanical survey of the property in 1987. Consulting the *Flora of Missouri* (Steyermark, 1963) yielded no help in identification, so the specimen was brought to the attention of Dr. Norlan Henderson when the Stone County specimens were donated to the University of Missouri, Kansas City, Herbarium. Dr. Henderson identified the plant as *Stenotaphrum secundatum*. The voucher specimen (Ellis 87-161) was added to that collection and additional specimens sent to Dr. George Yatskievych at Missouri Botanical Garden.

The location in which this grass was planted has been a key factor in its ability to persist so far out of its normal range. The grass was originally planted along a south-facing cinder block building and has formed a thick, thatchy strip 50 feet long and 5 feet wide. Smaller patches subsequently spread out spontaneously from this monocultural strip and thin to occasional patches where less protected. Table Rock Lake is within 150 yards of the site and the warming influence of a large body of water probably has helped the grass to persist. However, The area does receive a hard freeze each year, which is inconsistent with the natural range of this plant.

Care recommendations for this grass as a turf cultivar include moist, mucky soils and a neutral to alkaline pH, none of which it receives at its Missouri station. The site, if anything, is baked dry in summer and has pH 5-6. Although the plant does not seem to have expanded its original area much (a thorough survey of nearby areas has not been done), it has persisted in its original location for 28 years (filling in adjacent areas) without the introduction of additional material.

Figure 1. - Habit, a. portion of inflorescence, b. spiklet, c. portion of leaf with ligule.

Wildflowers of Mississippi by S. Lee Timme, copyright 1989. University Press of Mississippi, Jackson, MS, xx + 278 pp., cloth (ISBN 0-87805-395-6), \$40.00.

Mississippians have long awaited a manual of the state's flora and a guide to the state's wildflowers. The latter of these needs has been suitably met by this recent publication. With excellent reproduction of over 500 color photographs, this attractive book is equally at home on the coffee table or in the backpack. Dr. Timme, a Missouri native and graduate of Southwest Missouri State University, began putting together this guide while a doctoral student at Mississippi State University with encouragement of the Mississippi Native Plant Society.

The introductory section explains the organization of the 521 species described, which is alphabetical by family, genus, and species within the two classes --monocots and dicots. Also included are a map and brief descriptions of the ten physiographic regions of the state.

The body of the text consists of family and species' descriptions with a generous number of illustrating photographs. Following the scientific and common names, descriptions detail leaves, inflorescences, fruits, flowering dates, habitats, and distribution within Mississippi. Comments follow some entries describing uses of the plant, its geographic origin, similar species, or other notes. Technical terminology in the descriptions is minimized, and a glossary as well as line drawing of vegetative and floral characteristics are included before the single index of common and scientific names. The arrangement of the species by family and genus favors the use of the book by the professional over the amateur wildflower enthusiast. The addition of a simplified identification key to plant families would have facilitated the plant identification by those not knowledgeable of family characteristics.

While readers will recognize many species that our state has in common with Mississippi, many the plants from the coastal region of Mississippi may be unfamiliar.

Reference lists of floristic manuals and other wildflower guides applicable to the area are provided and will be useful for readers desiring additional sources of information on Mississippi plants. *Timothy E. Smith, Missouri Department of Conservation.*

ROBERT H. MOHLENBROCK: HIS BOTANICAL ROOTS AND HIS INFLUENCE ON MISSOURI BOTANY*

Wallace R. Weber
Department of Biology
Southwest Missouri State University
Springfield MO 65804

None of Dr. Mohlenbrock's professional botanical colleagues here today has known him quite as long as I; therefore, I believe it is appropriate that I should speak about his early botanical interests, those persons who influenced his very productive and distinguished career, and the impact of his influence on others.

My acquaintance with Bob goes back to the late 1940's when both of us were students at Murphysboro (Illinois) Township High School. There we came under the influence of Esther Smith (Figure 2), a biology teacher par excellence. Esther was one of those rare individuals whose enthusiasm for biology was not confined to the classroom. She had a well organized biology club whose members she encouraged to work on some kind of project. The emphasis of a majority of those projects was natural history. At the end of the year, if she thought they were worthy projects, only then were you allowed to enter the project into science fair competition. In the 1952 MTHS yearbook, a description of the Audubon Biology Club contains this passage in reference to science fair projects (1952):

"...they represent the results of many hours spent in field surveys and laboratory investigations. Members of this organization learn how to work scientific problems in connection with their various science projects. They have, and are still making, some real contributions to the natural history knowledge of southern Illinois."

Some of her student's science fair projects included such topics as Field Survey of Trees (Figure 1), The Ferns of Southern Illinois, the Mosses of Southern Illinois, the Reptiles and Amphibians of southern Illinois, and the Fish of Southern Illinois.

*This was the text of an address given by the author at the "Robert H. Mohlenbrock Symposium", a symposium honoring Dr. Mohlenbrock's retirement from the Department of Botany, Southern Illinois University, Carbondale.

Figure 1. Bob Mohlenbrock (right) and Kenneth Stewart (now Professor Stewart at Miami University, Oxford, OH) with their 1950 Science Fair Project.

Not only did Esther Smith encourage her students to work on these projects, but if it involved field work, she took them into the field to collect or observe whatever was necessary. All in all she had a great influence on her students, whether or not they continued their studies at the college level.

However, there was a small nucleus of seven students who graduated within a four year span, all of whom went on to Southern Illinois University-Carbondale to major in some area of biology. All ultimately obtained PhDs. Not only did this group represent a special group of students who were influenced by Esther Smith, but they in turn had an influence on each other long before receiving degrees, particularly on those in the group still in high school (Figure 2). Without a doubt, my enthusiasm for botany was enhanced by Bob Mohlenbrock, who taught me many species of flowering plants while I was still in high school, and before my first course in plant taxonomy. I am also quite certain that 3 of his peers--Bill Hardy, Tom Collins, and Ray Hatcher--who were all a year ahead of Bob in school, had some influence on him (Figure 2).

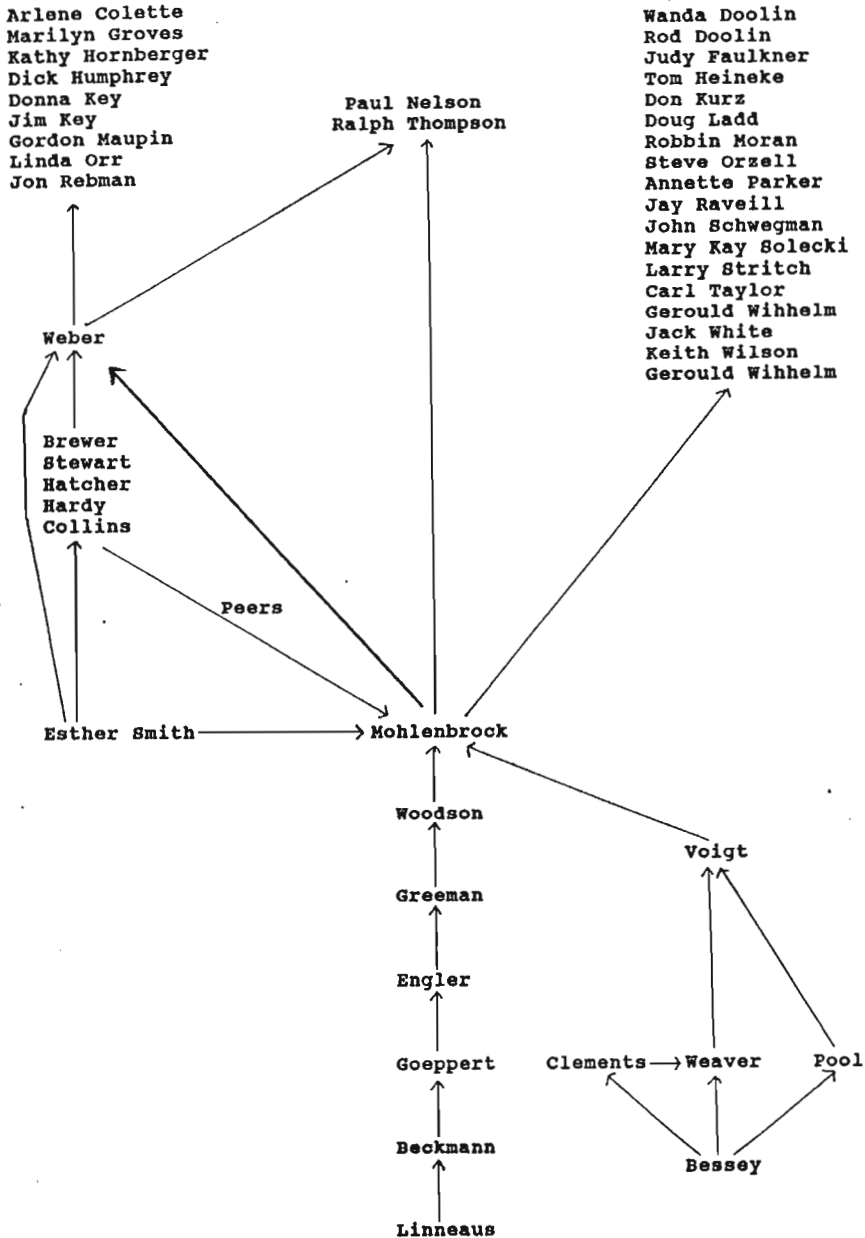

Figure 2. A chart depicting the "Academic Genealogy" of Robert H. Mohlenbrock. The lower half of this chart shows the relationship between RHM and his peers, teachers, and their teachers. The upper half shows his influence on others.

During the period that Bob pursued both his baccalaureate and master's degrees at SIU, he was obviously influenced by a number of his college professors, including Bill Marberry, Leo Kaplan, Walter Welch, and Margaret Kaeiser. The person who influenced him most at SIU, of course, was John Voigt (Figure 2), who taught him ecology and plant taxonomy and served as his thesis advisor as he completed a floristic study of Giant City State Park. During the years we were both students at SIU, we were field companions many times, and I learned much from him on those occasions.

After completing his master's degree at SIU, Bob went on to Washington University and the Missouri Botanical Garden in St. Louis, where he worked with Bob Woodson (Figure 2), his major advisor, on a monograph of *Stylosanthes*.

If we look a little deeper at Bob Mohlenbrock's "root system", we find he has a highly distinguished lineage, as do all of you who are his students. Robert Woodson, his PhD advisor, wrote in an address as the president of the American Society of Plant Taxonomists, the following (1954): "I have disciples now, and must remember that I am a son of Greenman, who was a son of Engler, who was a son of Goeppert, who was a son of Beckmann, who was a son of Linnaeus (Figure 2)." As a plant taxonomist, you can't have a genealogy much more impressive than that. Yet if we look at John Voigt's academic genealogy, we see that his lineage is just as impressive. Voigt studied under John Weaver, who was a student of Fredrick Clements, and both were students of Charles Bessey. In his book, "American Botany, 1873-1892", Andrew Denny Rodgers states that Bessey spent the winter of 1872-73 at Harvard studying under Asa Gray (Figure 2). This probably laid the foundations of his (Bessey) knowledge of systematic botany, especially in its philosophical aspects.

As you can see, I believe very strongly that the influence of others plays a great role in what kind of person each of us ultimately becomes. That is not to take anything away from our honoree. Bob Mohlenbrock is a unique and highly successful person, but part of what he is was shaped by those who taught him. Therefore, it seems appropriate to look at another aspect of Bob's contributions to botany--who are the persons Bob Mohlenbrock, in his 40+ years of teaching, has influenced and what have been their accomplishments?

Influence is accumulative, and if we look in totality at the accomplishments of Bob Mohlenbrock, including his sphere of influence on others, we would be here a long time. Therefore, since I have a special interest in the botany of the state of Missouri, I will restrict my remarks to his direct and indirect influence on "Missouri Botany."

Although Bob is considered to be "the" authority on Illinois plants, it is interesting to note that he has made a significant contribution to Missouri botany as well. I have divided my considerations into seven parts, each of which includes lists of

the contributions of either Robert H. Mohlenbrock, his students, or students of his students (Figure 2). In the case of 1st and 2nd generation students, the name in parenthesis indicates the teacher of that person.

1. CONTRIBUTIONS INVOLVING FLORISTIC STUDIES OF VARIOUS GEOGRAPHIC AREAS OF MISSOURI

The following list includes localities in Missouri that have been studied floristically either by RHM or 1st and 2nd generation students. Each study has resulted in either a published paper, thesis, or submitted reports; or represents a study still in progress.

Hickory Creek Canyon	Robert Mohlenbrock
Ball Mill Resurgence Area	Robert Mohlenbrock
Big Oak Tree State Park	Wanda Doolin (Mohlenbrock)
Bennett Spring State Park	Doug Ladd (Mohlenbrock)
Johnson Shut-Ins State Park	Paul Nelson (Mohlenbrock)
Hawn State Park	Mary Kay Solecki (Mohlenbrock)
Upper Aux Vas Creek	Carl Taylor (Mohlenbrock)
LaPetite Gemme Prairie	Paul Nelson (Weber)
Cedar Gap Area, Webster County, MO	Ralph Thompson (Weber)
Studies of Mingo National Wildlife Reserve	Ralph Thompson (Mohlenbrock)
Bona Glade Natural Area	Arlene Collette (Weber)
Roaring River State Park	Kathy Hornberger (Weber)
Montauk State Park	Gordon Maupin (Weber)
Piney Creek Wilderness	Jon Rebman (Weber)
Ha Ha Tonka State Park (In progress)	Marylin Groves (Weber)
Grand Gulf State Park (In progress)	Linda Orr (Weber)

2. CONTRIBUTIONS INVOLVING FLORISTIC STUDIES OF MISSOURI ECOSYSTEMS

Terrestrial Communities of Missouri	Paul Nelson (Mohlenbrock & Weber)
Missouri Glades	Doug Ladd (Mohlenbrock) & P. Nelson (Mohlenbrock)
Missouri Fens	Steve Orzell (Mohlenbrock)
Prairie Management Studies	Mary Kay Solecki (Mohlenbrock)

3. CONTRIBUTIONS INVOLVING THE STUDIES OF VARIOUS MISSOURI TAXA

Lichens of Missouri	Doug Ladd (Mohlenbrock)
Ferns of Missouri	Jim Key (Weber)
Illustrations of Ferns of MO	Paul Nelson (Mohlenbrock)

<i>Geocarpon</i>	W.R. Weber & R. Humphrey (Weber)
Woody Shrubs and Vines of MO (In progress)	Don Kurz (Mohlenbrock)
Illustrations of Shrubs and Vines of MO (in progress)	Paul Nelson (Mohlenbrock)

4. CONTRIBUTIONS BY PERSONS WHO HOLD POLICY MAKING JOB POSITIONS INVOLVING NATURAL AREA PRESERVATION, LAND MANAGEMENT, AND BOTANICAL STUDIES PROJECTS

Director of Natural History Section, DNR	Paul Nelson (Mohlenbrock)
Assistant Natural History Administrator, MDC	Don Kurz (Mohlenbrock)
Director of Stewardship Program, Nature Conservancy	Doug Ladd (Mohlenbrock)

5. CONTRIBUTIONS INVOLVING INVENTORY AND CONSULTING WORK OR OTHER AGENCY WORK

Rare Plant Survey (MDC)	Annette Parker (Mohlenbrock)
Wildlife Agent (MDC)	Rod Doolin (Mohlenbrock)
Rare Plant Survey (MDC)	Jay Raveill (Mohlenbrock)
Natural Heritage Botanist	Larry Stritch (Mohlenbrock)
Proposed Biosphere Reserve	Judy Faulkner (Mohlenbrock)
	Jack White (Mohlenbrock)
	Steve Orzell (Mohlenbrock)
Inventory (MDC)	
State Lands Inventory & Prairie Inventory (MDC)	Mary Kay Solecki (Mohlenbrock)
Floristic Survey of Bootheel Counties (Memphis Corps of Engineers)	Tom Heineke (Mohlenbrock)
Mississippi River Inventory	Dan Evans (Mohlenbrock)

6. CASUAL CONTRIBUTIONS BY PERSONS WHO HAVE COLLECTED IN MISSOURI, THEREBY CONTRIBUTING TO THE KNOWLEDGE OF ITS FLORA

Keith Wilson (Mohlenbrock)
John Schwegman (Mohlenbrock)
Gerould Wilhelm (Mohlenbrock)

7. MISCELLANEOUS CONTRIBUTIONS

Atlas Project Involving an Update of County Distribution Records	Wallace R. Weber (Mohlenbrock) Jay Raveill (Mohlenbrock)
Board Member and Charter Member of the Missouri Native Plant Society	Robert H. Mohlenbrock
Modern Pollen Spectra in Pond Sediments of Southwest Missouri	Dona Key (Weber)
R. H. Mohlenbrock's Regular Feature Article in Natural History Magazine Has Included Feature Articles About Several MO Areas in Mark Twain National Forest	Robert H. Mohlenbrock

In closing I would like to paraphrase a statement by Harry Baker Humphrey from his book, the "Makers of North American Botany." In his discussion of Charles Bessey, who on several occasions, visited Harvard University to study with Asa Gray, writes: "What the latter (Bessey) carried away from his teacher was to be reflected again and again in those who went out into the world from the Nebraska laboratory and lecture hall." As our friend and teacher, Bob Mohlenbrock, retires, let us not only remember his published contributions to botany, but that he passed on to us a legacy of the importance of field botany at a time when it was not always popular. And as we prepare to enter the 21st century, let us fervently hope that his legacy will live on and will be reflected again and again, not only by those of us who have gone out into the world from his laboratory at SIU, but by those to whom we have also passed this legacy.

MISSOURI BOTANICAL RECORD 12

Wallace R. Weber
Department of Biology
Southwest Missouri State University
Springfield, MO 65804-0095

William Corcoran
Department of Geosciences,
Southwest Missouri State University
Springfield, MO 65804-0095

The *Missouri Botanical Record* is the official register for new county records of all vascular plant taxa in Missouri. To qualify for inclusion in this record, a voucher specimen of the record taxon must be deposited in a recognized herbarium and verified by the curator. Following the format used below, please submit all records to Dr. Wallace R. Weber, Department of Biology, Southwest Missouri State University, Springfield, MO 65804-0095.

In the *Flora of Missouri*, Steyermark used only a single map number to refer to each species, even though several subspecific taxa were listed. In these instances, various symbols were used to represent each taxon on a single Missouri map with counties. In the *Missouri Botanical Record* a decimal system is used, with .1 assigned to the first subspecific taxon listed by Steyermark under each map, .2 for the second, and so on. Point nine nine (.99) is used to designate a species in which Steyermark included one or more subspecific taxa, but which was not specified by the collector. Point zero nine (.09) identifies a taxon not included by Steyermark. The letters "v" and "f" refer to variety and form respectively, while "nv" indicates that no subspecific category has been recognized.

Contributors for this issue include: Melvin Conrad, Dept. of Biology, Northwest Missouri State University, Kirksville, MO 63501, and Bill Summers, P. O. Box 6975, St. Louis, MO.
